I hope you all will read my Call to Arms for Interaction Designers:

<http://www.adaptivepath.com/blog/2007/08/28/a-call-to-arms-for->

Then start to work on the Interactive Gestures wiki I've started:

<http://www.interactivegestures.com>

I really think it is something important for this generation of interaction designers, and the IxDA as an organization, to get behind and work on.

Subject: [IxDA Discuss] forced choice widgets?

From: Alan Wexelblat <awexelblat@gmail.com>

Date: May 22, 2007 11:50:47 AM PDT

To: IxDA list

I have a workflow in which users can choose to move their data through processes, A, B, and C. Internally the states are actually a sequence. So if the person selects C we first move the data through A and then B.

I could present this as a radiobutton list, e.g.:

- ☐ Fold
- ☐ Spindle
- ☐ Mutilate

If the person selects Spindle, we secretly fold the data first, etc. The sequence is hidden. But sometimes the processes fail, so a user who selected Mutilate will find that his data Folded properly but couldn't be Spindled. This person finds himself looking at an error message generated by a process he didn't consciously choose. Plus his data are now Folded.

Or I could make the sequence explicit by doing something like checkboxes and not allowing the user to choose Spindle until Fold is first checked. But probably 60-75% of users don't really care about the sequence. They just want their data Mutilated and they object to

[Post a Response](#) | [Jump to Most Recent \(8\)](#)

I've been experimenting with a few new tools for reading the IxDA list. They've helped me get more out of these discussions lately, so I thought I'd invite the other long-suffering digest readers to try them out.

<http://www.howardesign.com/exp/ixd/>

The main page gathers the IxDA discussion archives (from dreamhost.com) into a blog-like interface. You'll see the entire month's posts in a sidebar organized by conversation (ala Gmail or Outlook) as well as the comments in a thread all stitched back together onto one page. Link to any thread or jump to the most recent comment in a post. You can even reply directly from the page.

Any suggestions or critiques are welcome.

This is great news! I have been using Thunderbird with thread view to be able to follow threads in the discussion, but it's not ideal. Sometimes the threading fails and finding a discussion thread that's older means I have to search it manually (they still have some work to do in the interaction here I think).

Link to any thread or jump to the most recent comment in a post. You can even reply directly from the page.

There's an RSS feed for new topics if you'd rather watch the list from your newsreader. You can also search the past two years of archives by topic or by author and view the results over time. Find everything we've ever written about usability or ethnography, watch questions about the mac menu surface every couple of months or search for "listera" in the fall of 2004.

Any suggestions or critiques are welcome.
